Component	Function / Problem Solved
Raspberry Pi 5 (8GB)	Acts as the main controller running ROS 2 for SLAM and navigation. Processes LiDAR, camera, and IMU data for map generation and decision-making.
Teensy 4.0	Handles motor PWM, encoder feedback, and IR sensor inputs. Provides precise timing and control, offloading low-level tasks from the Raspberry Pi.
RPLIDAR A2M12	Creates a 2D map of the environment for SLAM. Detects obstacles and provides accurate range data for localization and path planning.
Adafruit BNO055 IMU	Provides orientation and acceleration data for odometry input into SLAM. Works with the camera and sound sensors to correct drift in position and heading.
RPi Camera Module 3 Wide (IMX708)	Enhances map stability and SLAM accuracy, additional fault system for SLAM map
Ultrasonic Ranger Sensors	Fault system for SLAM processing so the map doesn't shift
FIT0186 Motors with Encoders (×2)	Provides differential drive motion and encoder feedback for odometry, enabling accurate position tracking during SLAM operations.
L298N Motor Driver (4 Pack)	Controls direction and speed of the drive motors via the Teensy. Converts control signals into motor output for smooth differential navigation.
TalentCell 12 V 26,400 mAh Battery	Powers the entire system, including the Pi, LiDAR, and motors. Provides stable voltage and long runtime for continuous SLAM operation.

RPLiDAR A2M12: Specification	**Value**
Type	2D Rotating Scanning LiDAR (Mechanical)
Cost	$229 USD
Range	0.2 – 12 meters
Accuracy	±2 cm
Update Rate	5 – 15 Hz (adjustable)
Sampling Rate	~16,000 samples/sec
Field of View	360° (Horizontal)
Interface	USB / UART
Power	5 V @ 500 mA
ROS / SLAM Support	Official rplidar_ros and rplidar_ros2 packages
Best Use Case	Full 2D SLAM Mapping for Indoor Mobile Robot
Notes	Excellent stability, mature SDKs, and low power draw.
